CEBIC TECHNOLOGIES OFFERS MONITORING APPLIANCE FOR IN-HOUSE SECURITY AND NETWORK HEALTH MONITORING

Denver, Colorado – Jan. 2007 – In response to client requests, Cebic Technologies has developed a new IntelliEye-4000 monitoring appliance that allows companies to conduct network and computer monitoring in-house, with all the sophistication of Cebic’s IntelliEye service.

Designed as a turnkey solution, the new IntelliEye-4000 appliance allows companies to monitor the health of server systems and individual computers, networking switches, bandwidth utilization, environmental systems, software applications and more.

“We call it “monitoring in a box,”” explains Cebic CEO Beate Hybinette. “It’s a network and computer monitoring solution that simply attaches to your network and provides the overview dashboard that allows your IT staff to detect system health immediately. The complete package includes hardware, software, probes, installation and an annual maintenance agreement for software updates.”

“In this business, there is no one-time solution,” she said. “It’s a continuous evolution and implementation of efficiency increasing technologies. That’s why outside managed services are seeing tremendous growth. Keeping up with continually changing technology issues, particularly with regard to security threats, is a very difficult time commitment to meet for IT staff with widespread responsibilities. Cebic is a resource our customers can count on when it comes to monitoring technologies.

Cebic Technologies was founded in 1997 to provide security solutions for entrepreneurial businesses, including remote intelligence monitoring of computer networks, virus screening, software updates, hardware and software status control and intrusion detection.
